                  Sequence 7, Application US/08800825A

Patent No. 5866397

GENERAL INFORMATION:
APPLICANT: RODAN, GIDEON A.
APPLICANT: SCHMIDT, AZRIEL
APPLICANT: SCHMIDT, AZRIEL
TITLE OF INVENTION: CINA ENCODING A NOVEL HUMAN PROTEIN
TITLE OF INVENTION: TYROSINE PHOSPHATASE
NUMBER OF SEQUENCES:
CORRESPONDENCE ADDRESS:
ADDRESSEE: J. MARK HAND - MERCK & CO., INC.
STREET: LILE OF LINCOLN AVE., P.O. BOX 2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Length 699;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 7, Application US/09158657
Patent No. 6214564
GENERAL INFORMATION:
APPLICANT: SCHMIDT, AZRIEL

              The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE ollagourleocite may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful in medical disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in
                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess blodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.
                                                                                                                                                                                                                                                                                          ;

diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.
                                                                            Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The enzyme encoded by this sequence is used in pharmaceutical, cosmetic

                                                                                                                                                                                                                                                                                                                                                         Human amyloid precursor protein protease (AAW05383) is involved in the processing or clearance of amyloid precursor protein to form beta-amyloid peptide. Its amino acid sequence was deduced from a cDNA clone (AAY39783) obtd. from a human lung library. Recombinant protease can be produced in transformed or transfected prokaryotic (partic. E. coli) or eukaryotic (partic. AV-120 host cells. It is used to develop products for the design and testing of cpds. useful for treating or preventing conditions associated with beta-amyloid peptide, esp. Alzheimer's disease.

Kallikreins and kallikrein-like proteins are a subgroup of the serine protease enzyme family. They catalyse the selective cleavage of specific polypeptide precursors to release peptides with potent biological activity. Nucleic acids encoding kallikrein-like proteins KLK-Li, KLK-L2, KLK-L3, KLK-L4, KLK-L5 and KLK-L6 have been isolated. The proteins are useful in the treatment, monitoring and diagnosis of cancers, especially prostrate cancer. They can also be used to identify a substance that can associate with or mediate the biological activity of the proteins. Antibodies can be used to treat conditions mediated by the kallikrein-like proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Stratum corneum chymotrypsin enzyme; SCCE; cytostatic; vaccine; tumour; cancer; ovarian; breast; lung; colon; prostate; carcinoma; human; antisense therapy; malignant hyperplasia.

The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AAO13910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopolesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                          The invention relates to diagnosing cancer especially ovarian cancer, by screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, carcinoma and malignant hyperplasia. The SCCE oligonuclectide may be used to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          screening for stratum corneum chymotrypsin enzyme (SCCE). Proteases are considered to be an integral part of tumour growth and metastasis, and therefore, markers indicative of their presence or absence are useful for the diagnosis of cancer. The method is useful for diagnosing cancer, the method is useful for diagnosing cancer, to treat a cancer selected from ovarian, breast, lung, colon, prostate and other cancers in which SCCE is overexpressed. The present sequence is human SCCE peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to diagnosing cancer especially ovarian cancer, by

AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively. AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human gastric cancer associated antigen protein sequence SEQ ID NO:944.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively.

AAB63232 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,
                                                                                                                                                                                                                       Human gastric cancer associated antigen protein sequence SEQ ID NO:942.

measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
              The invention relates to a single exon nucleic acid probe for
                                                                                                                                                               85.0%;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2000US-0632366

                                                                                                                                                                                                                                         qq
                                                                                                                                                                                                                                                                                                                              AAF22422 to AAF22626, AAF22627 to AAF22773 and AAF22774 to AAF23014 represent nucleotide sequences encoding human breast, gastric and prostate cancer associated antigen precursors (CAAP) respectively.

AAB62322 to AAB63467, AAB63468 to AAB63721 and AAB63722 to AAB63970 represent human breast, gastric and prostate CAAP protein sequence respectively. CAAPs have cytostatic activity and can be used in the production of cancer vaccines. The human CAAP proteins, peptides, nucleic acids or anti-CAAP antibodies are useful for diagnosing and treating a condition characterised by expression of an abnormal amount of a protein,

They can be used to measure gene expression in brain cell samples, which may enable the anginosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human brain expressed single exon probe encoded protein SEQ ID NO: 36942.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human

New nucleic acid encoding bovine conglutinin and its fragments - and related vectors, host cell, etc. useful e.g. in modulating conglutinin expression or for selective removal of cpds., carrying particular carbohydrate residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Conglutinin, including the complete sequence, the mature protein or the carbohydrate-binding fragments, are used to bind cells carrying the Clq receptor. Solid supports are used to remove compounds (especially proteins or peptides, e.g. immune complexes) having a carbohydrate component able to bind to the lectin region of conglutinin, optionally with recovery of bound compounds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 85.0%; Score 34; DB 16; Length 371; 77.8%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to single exon nucleic acid probes (SENP: see AAI31315-AAI57546). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                               Peptide #11808 encoded by probe for measuring placental gene expression.

Murine amyloid precursor-like protein I (APLPI) (AAR98903) is a novel member of the amyloid beta-protein precursor (APP)-like family, and includes regions (see also AAR88922-24) of homology to APP. It acts as an upstream stimulatory factor binding cpd., and is capable of down-regulating transcription from the APP gene promoter. Its amino acid sequence was deduced from a CDNA clone (AAT34694) obtd. from a mouse brain CDNA library. Elucidation of factors involved in the transcriptional regulation of the APP gene will help determine the mechanism which results in the formation of amyloid deposits and causes Alzheimer's disease.
                                                                                                                                                                                                                                                         Modulating transcription from amyloid beta-protein precursor promoter - using upstream stimulatory factor (USF), and USF-binding compounds such as amyloid precursor-like proteins APLP1 and APLP2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

                                                                                                                                                                                                                                                                     Modulating transcription from amyloid beta-protein precursor promoter - using upstream stimulatory factor (USF), and USF-binding compounds such as amyloid precursor-like proteins APLP1 and APLP2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                        3 Regions (AAR98922-24) of the mouse amyloid precursor-like protein APLP1 (see also AAR98903) show a high degree of homology to the human amyloid precursor protein (APP). The 3 regions respectively correspond to amino acids 21-210, 316-470 and 609-654 in extracellular domain I, extracellular domain II and the cytoplasmic domain of APLP1. APLP1 is an upstream stimulatory factor binding protein capable of down-regulating expression from the APP gene promoter. It is a new member of the APP-like
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         /note= "peptide used to raise antisera"

                                                                                                           polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques or restore normal activity of (II) or to treat disease states involving (II). (II) and its binding partners are useful in medical a food supplement. (II) and its binding partners are useful in medical imaging of strees expressing (II). (I) and (II) are useful in medical clisorders involving aberrant protein expression or biological activity. (The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations creponals for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human and adaption and products dependent on bland and and products and products of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                          Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
            New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations cresponsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and creamino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Murine; don-1 gene; melanoma; treatment; adenocarcinoma; EGf domain; epithellal cell; proliferation; stimulation; treatment; tumours; skin; oesophagus; lung; breast; liver; pancreas; colon; prostate; gastrointestinal tract; uterus; wound healing; transmembrane;
diagnostics, forensics, gene mapping, identification of mutation responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

The methods are useful for screening libraries of complexes for compounds with desired properties, especially the capacity to agonise, bind to or antagonise callular receptors. The processes allow distinctions to be made between compounds that merely bind to a receptor and compounds that are capable of transducing biological signals through the receptor.
                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Screening libraries of complexes for compounds with desired properties - using tethers which may be modified by a reporter molecule, modification indicates that a complex with the tether has
                                        The sequence is that of a leader sequence for the EGF domain of human don-1. It was used as part of the characterisation of don-1 bon-1 polypeptides stimulate proliferation of epithelial cells and thus are implicated in melanomas and adenocarcinomas in which epithelial cells proliferate out of control. Compounds that interfere with don-1 mediated cell proliferation can be used in the treatment of tumours such as melanomas and adenocarcinomas of the skin, oesophagus, lung, breast, liver, pancreas, gastrointestinal tract, collon, prostate or uterus. Alternatively, don-1 polypeptides can be used to stimulate epithelial cell proliferation, e.g. for wound healing.

AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) anino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and proteins and polynucleotides may be used in the prevention, diagnosis and example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome cappelement the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK84942 to AAK84950 and AAM82169 represent invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           qq
                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags contentifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving contentificating an expressed generating antibodies against it, detecting or contentificating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful in medical confiscers involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capposites, forensics, gene mapping, identification of mutations cand to produce other types of data and products dependent on DNA and and cand sequences. ABG00010-ABG30377 represent now DNA and canhon acid sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                    New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences can be used to produce DNA fragments containing full-length genes. Host cells transformed with the sequences can be used to produce polypeptides cells transformed with the sequences can be used to screen phage displays for polypeptide fragments, which can be used to screen phage displays for polypeptides that bind to them, or as tools for identifying agents active against towarian cancer, or to prepare medicaments for treating ovarian cancer. The CDNA sequences can be used to obtain genomic genes, their promoters, enhancers, allencers, exconsisting their promoters, enhancers, intron structures and their splice variants. AAY59724.Y58837 represent protein fragments encoded by the cDNA sequences represented in AAX41222-241324 which are derived from normal human ovarian tissue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1..21

                                                                                                                                                                                                                                                                                 ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This invention describes novel nucleic acid sequences that are highly expressed in normal ovary tissue. Artificial chromosomes and cosmid clones containing the sequences can be used as gene transfer vehicles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                    Nucleic acid sequences potentially useful in diagnosis or therapy of

                                                                                                                                                                                                                                                                                                                                                            g
                                                                                                                                                                                                                                                                                                                                                                                                                                              ó
                                                                                                                                                               New mammalian proteins designated dendritic cell specific transmembrane protein and DNAX surface protein and the nucleic acids encoding the polypeptides -
                                                                                                                                                                                                                                           The present sequence is human DNAX surface short form protein (DSP-1S). The DSP-1S is useful in forensic sciences, e.g. to distinguish rodent from human or as a marker to distinguish between different cells exhibiting differential expression or modification patterns. The DSP-1S and its antibodies are used for preparing kits for use in molecular biology, immunology or physiology, and in treatment of conditions associated with abnormal physiology and intreatment of allergic conditions (asthma), cancer and autoimmune diseases (diabetes mellitus). Drug screening using DSP-1S or its fragments can be performed to identify compounds having binding affinity to or other relevant isolation effects on the function of DSP-1S. The DSP-1S can also be used in diagnostic kits and methods for detecting the presence

The method is used as immunosuppressive therapy, e.g. in patients undergoing transplantation, but also for treating autoimmune diseases and allergy, e.g. exacerbation of asthma caused by viral infection. The CDB protein inhibits cytotoxic T cells in vitro or in vivo, amnd its inhibitory activity can be adjusted by mutation. Treatment with CDB protein provides more selective immunosuppression than use of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            T lymphocyte inhibition; CD8; immunosuppressive therapy; transplantation; autoimmune disease; allergy; asthma; viral infection; cytotoxic; corticosteroid; human; CD8 alpha protein.
                                                                                                                                                                                                                                     The complete nucleic acid sequence of human gp39 (hgp39) protein (corresp. to CDNA) and the complete AA sequence of hgp39 are presented in AAG57984 and AAR49548 respectively and contd. in plasmid CDM8-hgp39, deposited with the ATCC as E. coli, CDM8 MC1061/p3-hgp39 and assigned accession No. 69050. The human T cell antigen gp39 is a ligand for the CD40 receptor. Soluble gp39 any be produced using the expression vector CD8 gp39. Chimeric genes may be constructed by fusing sequences encoding the extracellular domains of gp39 and CD8, prf. murine or human CD8 protein. Plasmid p3-shgp39 encoding the fusion protein of the extracellular domains from gp39 and CD8 is deposited in E.coli as ATCC 69049.

The invention relates to a method for the preparation of active human chymase by transformation of a yeast host with a secretion expression vector containing DNA encoding mature human chymase, and culturing of the cells to give active human chymase. The recombinant DNA can be used to produce the human chymase protein. Using the method, human chymase can be produced easily and cost

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression in liver cancer tissue. Anti-CRTI antibodies or CRT cDNA can be used to detect or assay for CRTI or CRTI mRNA, indicating in which tissues CRTI expression is elevated, and therefore allowing liver cancer to be diagnosed and monitored.

                                                                                                                                                                                                                                                 transduction G-protein coupled receptors designated T2R proteins.
AABB731 to AABB7824 represent T2R proteins, and AABB7825 to AABB7830 represent T2R family consensus sequences from the present invention.
The T2R proteins are taste modulators. The nucleic acids are useful as probes for the identification of taste cells, as the nucleic acids are specifically expressed in taste cells. They also serve as tools for the generation of taste topographic maps that elucidate the relationship between the taste cells of the tongue and taste sensory neurons leading to taste centres in the brain. The taste modulators are useful for Modulatory compounds comprising T2R proteins can therefore be used in food and pharmaceutical industries to customise taste, for e.g. to decrease the bitter taste of food or drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               "Mature DNAX surface long form protein (DSP-1L)"

New mammalian proteins designated dendritic cell specific transmembrane protein and DNAX surface protein and the nucleic acids encoding the polypeptides \cdot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is human DNAX surface long form protein (DSP-1L). The DSP-1L is useful in forensic sciences, e.g. to distinguish rodent from human or as a marker to distinguish between different cells exhibiting differential expression or modification patterns. The DSP-1L and its antibodies are used for preparing kits for use in molecular biology, immunology or physiology, and in treatment of conditions associated with abnormal physiology or development, e.g. allergic conditions (asthma), cancer and autoimmune diseases (diabetes mellitus). Drug screening using DSP-1L or its fragments can be performed to identify compounds having binding affinity to or other relevant isolation effects on the function of DSP-1L. The DSP-1L can also be used in diagnostic kits and methods for detecting the presence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fas receptor; Fas ligand; FasL; apoptosis; screening; test compound; interaction; affinity ligand; identification; purification; therapy; overstimulation; premature cell death; fulminant liver damage; understimulation; lymphoproliferative disorders; autoimmune disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

                                                                                                                                                                                                                                                                                    This sequence represents a secreted modified human Fas ligand (secFL) which comprises human CDB secretory sequence and extracellular domain, heterologous marker sequences (a hexahistidine motif, and a Glu-Glu epitope tag) and the extracellular domain of Fas ligand (FasL). The protein is useful for in vitro or in vivo modelling and screening of test compounds to study the interaction between the Fas receptor and the Fas ligand and the effects of that interaction on downstream events, such as Fas mediated apoptosis. The protein may be used as an affinity ligand for the identification and/or purification of the Fas receptors. The protein is also useful for therapeutic applications in human manmalian patients. Such disorders are characterised by overstimulation, such as premature cell death and fulminant liver damage, or understimulation of the Fas mediated pathway, such as lymphoproliferative disorders and acceleration of autoimmune disorders.

The present invention describes primer sets for synthesising 5602

(ull-length cDNAs defined in the specification. Where a primer set
comprises: (a) an oligo-dT primer and an oligouncleotide complementary
to the complementary strand of a polynucleotide which comprises one of
the 5602 nucleotide sequences defined in the specification, where the
coligonucleotide comprises at least 15 nucleotides; or (b) a combination
of an oligonucleotide comprising a sequence complementary to the
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprising a sequence complementary to a
polynucleotide which comprises a 3'-end sequence complementary to a
complementary strand of a polynucleotide which comprises a 5'-end
sequence and an oligonucleotide comprises a selected complementary to a
complementary strand of a polynucleotide which comprises as 1'-end sequence, 3'-end sequence, 6'-end sequence, 7'-end sequence, 6'-end sequence, 7'-end sequence, 6'-end sequence, 6'-end sequence, 6'-end sequence, 7'-end sequence, 6'-end sequence, 6'-end sequence, 6'-end sequence, 6'-end sequence, 7'-end sequence, 6'-end sequence, 6'-end sequence, 7'-end sequence, 6'-end sequence, 6'-end sequence, 6'-end sequence, 6'-end sequence, 7'-end sequence, 6'-end sequence, 6'-end sequence, 7'-end sequence, 6'-end sequence, 8'-end sequence, 6'-end sequence, 8'-end sequence, 6'-end sequence, 8'-end sequence, 6'-end sequence, 6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

                                                                                                                                                                                                                                                                                                                                                                  A cDNA bank was established from polyA-RNA of a fibroadenoma and screened with probes derived from polyA-RNA of metastatic tumours. Clones binding strongly were selected; one of these was found to be expressed at a high level only in malignant cancers of the breat, deterioration of the extracellular matrix. This clone, which encodes stromolysin-3 (ST3), was sequenced (AAQ25698). A probe corresponding to human cDNA encoding ST3 was used to screen a mouse placenta cDNA library. This led to the isolation of cDNA with the sequence in AAQ35699. A comparison of the mouse and human ST3 sequences revealed B9% homology in the amino acids of the mature protein; and approximately 55% homology in the pre- and pro-domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps

AAA16618 to AAA16697 encode the human secreted proteins given in AAY94898 to AAY94980, isolated from human adult brain, adult thyroid, adult retina, foetal carcinoma, adult blood, adult neural, foetal kidney, adult placenta, adult testis, whole embryo, adult cartilage, kidney, cotal brain, adult thymus, foetal placenta, adult uterus, adult tumour, of the hological activities which would make them suitable predicted to have bloological activities which would make them suitable or treating, preventing or ameliorating medical conditions in humans and animals. The polynucleotides can be used as markers for tissues in which the protein is preferentially expressed, as molecular weight markers on Southern gels, and as chromosome markers or tags to identify chromosomes or to map gene positions. The proteins can be used in the treatment of immune deficiencies and disorders, such as severe combined immunedeficiency (SCID), as well as viral, bacterial, fungal and other infections. These infections include human immunodeficiency virus (HIV), bepatitis, herpesviruses, mycobacteria, Leismania spp, malaria and candidatasis. The proteins and the used to treat autoinfunned alsorders such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       as connective tissue disease, multiple sclerosis, systemic lupus erythematosis, rheumatoid arthritis, autoimmune pulmonary inflammation, Guillain-Barre syndrome, autoimmune thyroiditis, insulin dependent diabetes mellitus, myasthenia gravis, graft-versus-host-disease and autoimmune inflammatory eye disease. The proteins can also be used to treat allergic conditions, such asthma. AAA16698 to AAA16774 represent probes for the human secreted proteins from the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; primer; detection; diagnosis; antisense therapy; gene therapy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Either intact enzyme or fragments thereof can be used to generate antibodies for diagnostic use. Oligonucleotide probes can also be made which are complementary to the sequence encoding the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    (INRM ) INSTITUT NATIONAL DE LA SANTE ET DE LA RECHERCHE MEDICALE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comptises: (a) an oligo-dT primer and an oligounclectide comptiementary to the complementary strand of a polynuclectide which comprises one of the 5602 nuclectide sequences defined in the specification, where the oligonuclectide comprises at least 15 nuclectides; or (b) a combination of an oligonuclectide comprising a sequence complementary to the complementary strand of a polynuclectide which comprises a 5'-end sequence and an oligonuclectide comprising a sequence complementary to the polynuclectide which comprises a 3'-end sequence complementary to a polynuclectide which comprises a 3'-end sequence complementary to a polynuclectide comprises at least 15 nuclectides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in the 5'-end sequence/3'-end sequence is selected from those defined in the gene therapy. The primers are useful for synthesising polynuclectides, particularly full-length cDNAs. The primers are also useful for the proteins encoded by the full-length cDNAs. The primers allow obtaining of the full-length cDNAs ability of the proteins encoded by the full-length cDNAs are primers allow obtaining of the full-length cDNAs and seasily without any specialised methods. Peptide Protein

```
Protein #6302 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                              Human; foetal liver; gene expression; single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human genome-derived single exon nucleic acid probes useful for analyzing gene expression in human fetal liver
                                                                                                                                                                                                                                   Peptide #7106 encoded by human foetal liver single exon probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Claim 27; SEQ ID NO 32235; 639pp + sequence listing; English.

                                                             HID SECOND COUNTY SECOND COUNT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     This is human angiotensin converting enzyme (ACE). The ACE gene (see AAV41320) is polymorphic with 2 common alleles (I and D), resulting in 3 genotypes, II, ID and DD. It is an object of the invention to identify individuals possessing a certain genotype and associated allment, and to determine if the health of that individual can be improved by altering behavior. A claimed method comprises identifying individuals having a certain phenotype, or counteract the phenotype, and instituting a lifestyle change to exploit with the phenotype, and instituting a lifestyle change to exploit with the phenotype, and instituting a lifestyle change to exploit with the phenotype as appeared by the gene marker. If the phenotype is hypertension, the gene marker is at least one consertion (I) ACE allele and exercise training is instituted to decrease systolic and diastolic blood pressure. The gene marker can be identified by PCR amplification (see AAV41221-22) of the appropriate gene region. The general method can be used to identify subjects who will benefit most from physical exercise
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Analysis of genetic markers to identify subjects who will benefit from exercise - also assessing risk of cardiovascular disease from angiotensin-converting enzyme genotype
                                                                                                                                                                                                                                                                     Angiotensin converting enzyme; ACE; hypertension; exercise; human;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of
                                                                                                                                                                                                                                                                                                                                                          Single exon nucleic acid probes for analyzing gene expression in human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention provides a number of single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human bone marrow expressed probe encoded protein SEQ ID NO: 33244.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; bone marrow expressed exon; gene expression analysis; probe;

                                                                                                                                                                                                                                                                                                             ö
                                                                                                                         The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancers such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPS are derived from human HeLa cells. The SENPS can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Peptide #6215 encoded by probe for measuring cervical gene expression

The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of
                                                                                                                                                                                              Peptide #7200 encoded by probe for measuring placental gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
